Major Areas of Professional Interest

I use mathematical, statistical and computationally-intensive approaches to study the causes and consequences of population dynamics. Motivated by the ambition to improve people's lives through the scientific study of our societies, I am consolidating a portfolio that leverages interdisciplinary approaches to monitor demographic change, to explain population processes, and to predict future demographic outcomes. More specifically, my research addresses three main inter-related topics: (i) combining large social media data with traditional sources to track and understand migrations; (ii) evaluating the consequences of population aging on intergenerational transfers; (iii) modeling the relationships between population dynamics, the environment and infectious diseases. A common thread across my substantive interests is a consistent drive to develop methods and to analyze data in creative ways that further advance our understanding of social phenomena.
